

INTERLOCKING FASTENERS FOR MOUNTING WALL-HUNG ARTICLES

ABSTRACT OF THE DISCLOSURE

5 A clip for hanging articles from a wall has planer first and second sides which are offset from one another to provide a predetermined clip width. One edge of the clip is a Z-shaped contact surface, having a first face which angles forwardly from one of the sides, a second face which angles rearwardly from the other side and a third face which extends between the first and second faces. The first and second faces are
10 relatively short and extend from their respective sides at a relatively large angle. The third face is considerably longer than the first and second faces and is at a relatively shallow angle with respect to the sides. One piece of the clip is attached to an object to be hung and another piece is reversed top to bottom and front to back and attached to a wall.
